The purpose of the study was to determine to what extent that an individual's marksmanship performance is degraded after a one, two, three, or four plus year gap in his small arms weapon requalification history. The study reviews the physiological aspects of proficient shooting and the effects of the environment on marksmanship shooting. The analysis was performed on the complete qualification history of 1,694 U. S. Marine Corps officer and enlisted personnel who had qualified with a pistol or rifle three or more times during

SECURITY CLASSIFICATION OF THIS PAGE/When Data Entered

air Marine Corps career. The results of the analysis indicated that there was no statistical degradation in shooting performance for both the officer and enlisted populations over gaps of one or more years when firing the rifle. In the case of the pistol, there is no statistical degradation in performance for the officer population with a gap of one or more years in shooting history; however, the enlisted population shows statistical evidence of degradation in performance after a three or more year gap in shooting history.

I. INTRODUCTION

A. PURPOSE

The purpose of this study is to determine to what extent an individual's marksmanship performance is degraded after a break in his small arms weapon requalification history. This study tests the null hypothesis that marksmanship performance is not degraded after a break in small arms weapon requalification against the alternative hypothesis that marksmanship performance is degraded following a break in small arms weapon requalification training.

The study reviews the physiological aspects of proficient marksmanship shooting which involves the human motor apparatus, the visual system, the breathing process and the environment in which the marksman is performing his skills. The study analyzes the complete qualification history of U. S. Marine Corps officers and enlisted personnel who had qualified with a rifle or pistol for requalification three or more times during their Marine Corps career. A review of Marine Corps policy and procedures regarding marksmanship training is presented so that the reader will have an understanding of how the data base utilized in the study was generated.

The data analysis portion of the study analyzes a break or gap of one, two, three, or four plus years in the requalification cycle of an individual Marine and its effect on his marksmanship performance. A regression analysis was performed

in terms of time and gains or drops in score across gaps in shooting histories. This provides a method of testing the significance of changes in score over time.

B. PHYSIOLOGICAL CONSIDERATIONS

"The Marine rifleman of the next conflict will be, as he has been in the past, among the first to confront the enemy and the last to hang his weapon in the rack after the war is won." [Ref. 1]

The above quotation illustrates the importance of marksmanship training for the individual Marine, whether he is an officer or enlisted, infantryman or jet mechanic. Each Marine is trained as a Marine rifleman with emphasis on marksmanship proficiency to the extent that he would be capable of effectively applying learned shooting skills in a combat environment [Ref. 1]. In the process of developing individual small arms proficiency, numerous physiological aspects of the human body must be considered. The physiological aspects of proficient marksmanship shooting involve the human motor apparatus, the visual system, the breathing process, and to some extent, the environment in which the marksman is performing his skills.

1. Human Motor Apparatus

A study performed by A. A. Yur'yev [Ref. 2] analyzed the human motor apparatus subdivided into the system of muscles and the system of bones and ligaments and their interaction when attaining an optimum shooting position. He analyzed the prone, kneeling, and standing positions in detail and determined that the most stable shooting position is the prone, since the body of the rifleman has a low center of gravity

position. The least stable position was the standing position due to the difficulty of attaining complete equilibrium between the body and the weapon. This is largely due to the fact that the weapons center of gravity is located at a distance away from the central line of the rifleman's body requiring a compensating deviation of the torso to create a counterbalance to the rifle. The kneeling position is more stable than the standing position due to the lower center of gravity and greater weight distribution.

2. Visual System

A. A. Yur'yev's [Ref. 2] study also involved an analysis of the visual system which is required to attain proper sight alignment and sight picture during the process of aiming the weapon. The study included the effects of nearsightedness, farsightedness and spherical aberration as they affect shooting performance. His analysis determined that nearsightedness was easily corrected with glasses enabling the shooter to maintain good shooting scores whereas farsightedness was determined to be hard to correct with proper shooting scores. In his discussions of spherical aberration, he identified the need to ensure that the aiming devices do not shine brightly producing a blinding effect on the eye. This difficulty is easily solved by blackening the sights.

In the process of aiming, it is necessary to prevent eye fatigue which can be induced by prolonged aiming. After 12 to 16 seconds, Yur'yev indicates that the eye ceases to

notice inaccuracies in the aiming factors of sight alignment and sight picture. Yur'yev further recommends that the aiming process should not exceed 6 to 8 seconds. In order to rest the eyes, he found that it was helpful to look at distant dull surfaces which exhibit even tones of gray, green, or blue.

3. Breathing Process

A. A. Yur'yev [Ref. 2] analyzes the critical aspects of breathing rhythm on marksmanship firing. He deduced from his study that an individual can hold his breath for 12 to 15 seconds without special labor. Longer periods result in higher level of carbon dioxide in the blood resulting in muscle reactions which can have an effect on the steadiness of the weapon. This is due in large part to the fact that the process of breathing consists of a combination of physiological processes which constantly occur in an organism and are linked with blood circulation, gas exchange, metabolism and the nervous system of the organism. The proper control of breathing is necessary to prevent unnecessary movement of the weapon during the aiming and firing process.

4. Coordination of Aiming, Breathing, and Trigger Squeeze

Prior to firing the weapon at a target, it is desirable that the shooter consider the coordination of aiming, breathing and trigger squeeze during the weapon firing sequence. A. A. Yur'yev's [Ref. 2] study identified the technique of trigger pull as being "of very great importance in producing an accurate

shot." The coordination of aiming, breathing and simultaneously squeezing the trigger is of great importance during the process of firing a weapon. During the trigger squeeze evolution, the shooter must maintain a steady aim and to do so, he must also control his breathing. If his breathing is not controlled, the weapon may move, resulting in the point of aim not being on target, and an inaccurate shot being fired. In order to maintain proper coordination, Yur'yev suggests that the trigger be smoothly pulled straight back with a maximum time for trigger squeeze to be 2 to 2.5 seconds.

5. Weapon Steadiness as Related to Experience

A study performed by Rigby [Ref. 3] tested the hypothesis that a group of shooters which had had rifle training with improved levels of skills at rifle marksmanship should perform better on a test of rifle steadiness than a similar group which did not have any rifle training. The results of the test showed that rifle training did not improve rifle steadiness. His study also supported the idea that shooting high scores requires being an expert at pulling the trigger at the proper time when sights are properly aligned with the target. He also points out that most models used to predict performance for individual competitions did not accurately predict because they could not account for physiological and situational variables of competition.

6. Environmental Influences

A study performed by Lunsford [Ref. 4] demonstrated that there are certain statistical aspects of weapon training and temperature which lead to a conclusion that climatic conditions can have an appreciable effect on the qualification scores of marksmanship training. He noted that with a humidity factor of 30 to 70%, the following effects of temperature may be evident:

85°F - Mental deterioration begins

75°F - Physical deterioration begins

65°F - Optimum conditions for physical activity

50°F - Physical stiffness of hands begin

The Fleet Marine Force Manual, FMFM 1-3 [Ref. 1] indicates that wind, illumination, temperature and humidity all have some effect on the shooter. The manual further notes that the effect of wind is the greatest problem to the shooter, particularly in the standing position where the stronger the wind, the greater the difficulty of holding the weapon steady. The effects of the wind, depending on its direction, also have a pronounced effect on the projectile as it travels down range. A tail wind or head wind has very little effect on the projectile, but a cross wind does have a significant effect. Wind can be compensated for by adjustment of sight alignment. The military rifle is equipped with adjustable sights which can be adjusted for the effects of wind, thereby reducing the inaccuracies of firing a rifle in a cross wind.

C. MARINE CORPS MARKSMANSHIP TRAINING

1. Marine Corps Small Arms Marksmanship Training Objectives

Marine Corps Order 3574.2F provides that the objective of marksmanship training is to develop marksmanship proficiency to the highest practicable level in individuals and tactical units. The purpose of annual small arms requalification training is to maintain or refine marksmanship proficiency with a minimum performance objective of at least a Marksman classification [Ref. 5].

2. Weapon Types

The Marine Corps currently utilized the M1911A1 .45 caliber pistol, the Smith and Wesson Model 10 .38 caliber revolver and the M16A1 service rifle which fires a 5.56mm round.

3. Marine Corps Marksmanship Program

Marine Corps Order 3574.2F [Ref. 5] establishes Marine Corps policy and prescribes required actions concerning marksmanship training with individual small arms.

a. Marine Corps Policy

Marine Corps policy requires that every Marine be thoroughly trained and capable of using, safely and effectively, those individual small arms weapons appropriate to the Marines' rank and duty assignment. Male Marine officers fire for initial qualification with both the rifle and pistol, whereas the male enlisted Marine fires the M16A1 service rifle for initial qualification during recruit training. Thereafter, those skills

which were attained during initial marksmanship training are supposed to be maintained or improved through annual requalification firing. Women Marines are provided marksmanship training and fire for requalification only when armed in the performance of their assigned duties [Ref. 5].

b. Requalification Requirements

Marine Corps requalification requirements are broken down into two categories, Regular ground organizations and Regular aviation organizations. Each organization has specific requirements which must be met in the annual requalification cycle.

(1) Marines Assigned to Regular Ground Units.

Marines assigned to Regular ground organizations are required to fire the M16A1 service rifle for requalification on the known distance (KD) course which is described in Appendix A. The training spans a five day period except for those Marines whose last recorded qualification was Expert, they may choose to fire for record on the third day of training. Appendix A provides for each type of qualification course; the type of range, event times for strings of fire, number of rounds fired per string, the target type utilized, the firing position, and the score/classification breakdown. Those Marines who are armed with the M1911A1 pistol or .38 revolver are required to fire the pistol "A" course for requalification as described in Appendix A. The training spans a five day period with one hour per day involving live fire exercises.

(2) Marines Assigned to Aviation Organizations.

Marines assigned to aviation organizations are required to fire the M16A1 service rifle for requalification on the "B Modified" course, as described in Appendix A, which requires three days of live fire training. Male enlisted Marines are required to fire the KD course for requalification every four years. Those Marines armed with the M1911A1 pistol or the .38 caliber revolver are required to fire the pistol "A" course for requalification. The training spans a five day period with one hour per day involving live fire exercises.

4. Record Keeping Requirements

Marine Corps Order 3574.2F [Ref. 5] sets forth strict procedures and guidelines which must be utilized for recording marksmanship record firing results. Once a Marine has declared his intentions to fire for record, that individual is prohibited from receiving any coaching assistance during the record firing events identified for each marksmanship course in Appendix A. Appendix B provides specific procedures and requirements utilized in the determination of a final qualification or requalification score resulting from the record firing events. The final score becomes a permanent record to be recorded in the Officer's Qualification Record (OQR) or the Enlisted Service Record Book (SRB), as appropriate, with the date of qualification, the type of weapon fired, the marksmanship course qualified upon, the score and the qualification classification. Appendix C depicts the type of entries recorded on the NAVMC 118 form utilized for recording marksmanship scores.

D. DIFFERENCES BETWEEN A .45 CALIBER AND .38 CALIBER WEAPON

There have been conflicts of opinion concerning the handling characteristics of the M1911A1 .45 caliber pistol and the Smith and Wesson .38 caliber revolver. Featherstone and Scaglione [Ref. 6] discovered in their study that there were no statistical differences in the handling characteristics of the M1911A1 .45 caliber pistol and the Smith and Wesson .38 caliber revolver.

It is to be noted that throughout the past 20 or more years, the Marine Corps has not differentiated between the M-1 service rifle, M-14 or M16A1 service rifles in regards to target scores. All three weapons have been fired on the same type ranges without score or qualification modifications. The same is also true for the .45 and .38 caliber weapons.

E. FISCAL ASPECTS OF MARKSMANSHIP TRAINING

The cost of small arms ammunition is continually rising necessitating money saving programs on the part of the Marine Corps. A Navy Times article [Ref. 6] identified that a recent scarcity of .45 caliber ammunition within the Marine Corps required the discontinuation of pistol requalification during the 1980 calendar year except for a small number of selected occupational specialties.

II. METHOD

A. DATA ACCUMULATION

The process of data accumulation involved reviewing 5,800 personnel records maintained by subordinate units of the 3rd Marine Aircraft Wing located at Santa Ana, California, and the 1st Marine Division located at Camp Pendleton, California. Personnel records were reviewed in an alphabetical sequence. From the record books reviewed, the following data were recorded for those individuals who had qualified with a particular weapon type three or more times during their career:

Military Occupational Specialty (MOS)

Type of Weapon Fired

Type of Firing Course Qualified Upon

The Year of Qualification in terms of numerical
accession from the first year fired

The Qualification Scores

The above elements were recorded on an 80 card column form in the format depicted by Appendix D. Appendix C represents the NAVMC 118 form utilized by the Marine Corps to record individual marksmanship qualification data for each individual Marine and is a permanent part of the personnel record.

B. DISTRIBUTION OF THE DATA

Table I represents the major Marine Corps commands from which the data were extracted and consists of the number

of records reviewed per unit and the number of data sets that were extracted from that unit.

TABLE I. BREAKDOWN OF DATA EXTRACTION

| <u>UNIT</u> | <u>NUMBER OF PERSONNEL RECORDS REVIEWED</u> | <u>NUMBER OF DATA SETS EXTRACTED</u> |
|-----------------------------|---|--|
| 1ST MARDIV | | |
| 7th Marines | 1400 | 340 |
| 11th Marines | 1550 | 300 |
| Division Headquarters | 250 | 168 |
| Total | 3200 | 808 |
| 3RD MAW | | |
| MAG-11 | 1600 | 520 |
| MAG-16 | 600 | 245 |
| H&HS, MCAS (H) Santa Ana | 400 | 121 |
| Total | 2600 | 886 |

Table II shows a breakdown of the extracted data set by major command and by officer and enlisted categories.

TABLE II. BREAKDOWN OF OFFICER AND ENLISTED DATA

| <u>MAJOR UNIT</u> | <u>OFFICER</u> | <u>ENLISTED</u> | <u>TOTAL</u> |
|-----------------------|----------------|-----------------|--------------|
| 1ST MARDIV | 225 | 583 | 808 |
| 3RD MAW | 213 | 673 | 886 |
| Total | 438 | 1256 | 1694 |

Table III shows a breakdown of the data by Military Occupational Specialty (MOS).

TABLE III. BREAKDOWN OF DATA BY MILITARY
OCCUPATIONAL SPECIALTY (MOS)

| <u>MOS</u> | | <u>OFFICER DIVISION</u> | <u>OFFICER WING</u> | <u>ENLISTED DIVISION</u> | <u>ENLISTED WING</u> |
|------------|--------------------------|-----------------------------|-------------------------|------------------------------|--------------------------|
| 0100 | Administration | 10 | 5 | 22 | 25 |
| 0200 | Interragotor | 6 | 5 | 10 | 8 |
| 0300 | Infantry | 74 | 0 | 270 | 30 |
| 0400 | Logistics | 12 | 2 | 8 | 5 |

| 7000 | Aviation/ Electronics | 12 | 150 | 2 | 28 |
| | Totals | 226 | 233 | 583 | 656 |

C. DATA ANALYSIS

1. General

The data analysis consisted of analyzing the score differences (Δ SCORE) across the first gap/break to occur in an individual's shooting history where Δ SCORE = SCORE (IMMEDIATELY AFTER GAP) - SCORE (IMMEDIATELY BEFORE GAP).

For those individuals without a gap in shooting history, the score differences are between the last time that an individual had fired and the first time that he had fired for qualification where $\Delta \text{SCORE} = \text{SCORE} (\text{LAST TIME FIRED}) - \text{SCORE} (\text{FIRST TIME FIRED})$.

The analysis was performed upon the following seven data groups:

Officer-Division

Officer-Wing

Enlisted-Division

Enlisted-Wing

Officer Combined

Enlisted Combined

Officer-Enlisted Combined

Figures (1) through (4) are histograms of the ΔSCORES for those individuals contained within the Officer-Enlisted Combined data sets.

2. Analysis of Variance

An analysis of variance was performed on the Officer-Division, Officer-Wing, Enlisted-Division, and Enlisted-Wing data groups to determine if there were any significance associated to the treatment groups of individual shooters and time. The Randomized Block Design presented in Hicks [Ref. 8] was utilized to test the hypothesis that there are no treatment effects. The analysis was performed on both

Figure(1) Pistol A score for Officer-Enlisted Combined with a Gap

Figure(2) Rifle Δ score for Officer-Enlisted Combined with a Gap

Figure(3) Pistol Δscore for Officer-Enlisted Combined without a Gap

Figure(4) Rifle Δ score for Officer-Enlisted Combined without a Gap

rifle and pistol weapon types. The level of significance (α) used to test the hypothesis was .1.

3. Contingency Table Analysis

A contingency table analysis was performed for both rifle and pistol weapon types to test the hypothesis that there is no statistical difference in Δ SCORES associated with the populations being tested. The level of significance (α) used to test the hypothesis was .1. The Δ SCORES were accumulated into frequency tables for all of the data groups listed in paragraph one. The analysis involved using the Chi-square test as presented in Siegel [Ref. 9] for Δ SCORE versus the below listed data sets for the no gap, the one, two, three, and four plus year gaps in shooting history:

Set 1: Officer-Division, Officer-Wing, Enlisted-Division, Enlisted-Wing

Set 2: Officer-Combined, Enlisted-Combined

Set 3: Officer-Enlisted Combined

In addition, the contingency table analysis was performed on each of the population groups in paragraph one to test the hypothesis that there is no statistical differences in Δ SCORES for zero, one, two, three, and four plus year gap in shooting history with a significance level (α) of .1.

4. Regression Analysis

A regression analysis was performed on the Officer-Combined, Enlisted-Combined and the Officer-Enlisted Combined data sets for both the pistol and rifle weapon tests by utilizing the APL program provided by Richards [Ref. 10] contained

within the Naval Postgraduate School computer library. The analysis involved regressing Δ SCORE with Time (in years) to test the hypothesis that the Δ SCORES over time, or over a gap in shooting history, have a zero slope. A zero slope would indicate that a shooters' performance over time is not degraded across a specific gap size. The hypothesis was tested at a significance level (α) of .1.

III. RESULTS

A. POPULATION STATISTICS

In the process of analyzing the data, the mean scores and standard deviations for both the pistol and rifle weapon types were calculated and tabulated in Tables IV and V for the following population groups:

Officer-Division

Officer-Wing

Enlisted-Division

Enlisted-Wing

Officer Combined

Enlisted Combined

Officer-Enlisted Combined

Table IV displays the mean scores and standard deviations for all individuals contained within the seven population groups. Since all mean pistol scores are greater than 290 and the mean rifle scores are greater than 210, then from the marksmanship classification breakdown provided in Appendix A, all of the scores listed in Table IV fall into the Marine Corps marksmanship classification of Sharpshooter.

Table V displays the mean scores and standard deviations only for those individuals who had had a gap or break in their requalification history. Again, all of the mean pistol and rifle scores listed fall into the Sharpshooter classification

which is significant since the minimum performance objective is at least a Marksman classification [Ref. 5].

TABLE IV. STATISTICS FOR ALL INDIVIDUALS

| DATA SET | NUMBER SUBJECTS | | MEAN SCORE | | STD. DEV. | |
|----------|-----------------|--------------|---------------|--------------|---------------|--------------|
| | <u>PISTOL</u> | <u>RIFLE</u> | <u>PISTOL</u> | <u>RIFLE</u> | <u>PISTOL</u> | <u>RIFLE</u> |
| Off-Div | 110 | 114 | 323.8 | 222.3 | 32.4 | 16.8 |
| Off-Wing | 131 | 101 | 336.9 | 219.7 | 29.6 | 20.5 |
| Enl-Div | 85 | 497 | 306.6 | 212.3 | 38.3 | 14.6 |
| Enl-Wing | 140 | 515 | 313.9 | 212.2 | 36.0 | 14.5 |
| Officer | 241 | 216 | 331.1 | 221.1 | 31.6 | 18.6 |
| Enlisted | 226 | 1012 | 311.0 | 212.2 | 37.2 | 14.5 |
| Off-Enl | 467 | 1228 | 321.4 | 213.8 | 35.8 | 15.7 |

TABLE V. STATISTICS OF INDIVIDUALS WITH A GAP IN THEIR SHOOTING HISTORY

| DATA SET | NUMBER SUBJECTS | | MEAN SCORE | | STD. DEV. | |
|----------|-----------------|--------------|---------------|--------------|---------------|--------------|
| | <u>PISTOL</u> | <u>RIFLE</u> | <u>PISTOL</u> | <u>RIFLE</u> | <u>PISTOL</u> | <u>RIFLE</u> |
| Off-Div | 68 | 72 | 324.4 | 221.2 | 32.2 | 19.5 |
| Off-Wing | 101 | 75 | 337.2 | 219.2 | 30.4 | 25.1 |
| Enl-Div | 63 | 173 | 306.4 | 213.6 | 38.9 | 15.1 |
| Enl-Wing | 87 | 295 | 315.3 | 212.5 | 35.7 | 15.4 |
| Officer | 168 | 148 | 331.9 | 221.0 | 31.8 | 21.7 |
| Enlisted | 151 | 468 | 311.3 | 213.1 | 37.6 | 15.3 |
| Off-Enl | 319 | 616 | 322.1 | 214.8 | 36.2 | 17.2 |

B. ANALYSIS OF VARIANCE (ANOVA)

An analysis of variance was performed on the Officer-Division, Officer-Wing, Enlisted-Division and Enlisted-Wing population group to test the hypothesis that there are no treatment effects

at a level of significance of .1. The analyses were performed by taking a random sample from each population group. The sample consisted of the first fifteen individuals who did not have a gap in their shooting history. There were three population groups in which it was not possible to obtain fifteen individual sets of scores due to the prevalence of gaps in the individual's shooting history. In these cases, the sample size utilized in the analysis was reduced. Table VI provides a tabulated summary of ANOVA analyses for both the pistol and rifle weapon types. Table VI displays the F-ratio generated by the Randomized Block Design presented by Hicks [Ref. 8], a "YES" if the individual or if time was significant or a "NO" if insignificant and the sample size used in the ANOVA. The below ANOVA summary is a sample of ANOVA tables that are summarized in Table VI.

| ANOVA (Enlisted-Division) | | | | |
|---------------------------|-----------|-----------|-----------|----------------|
| <u>SOURCE</u> | <u>DF</u> | <u>SS</u> | <u>MS</u> | <u>F-RATIO</u> |
| Individual | 14 | 65854 | 4705 | 6.76 |
| Time (YRS) | 5 | 5017 | 1003 | 1.44 |
| Error | 70 | 48715 | 696 | |
| Total | 89 | 119586 | | |

The results of the ANOVA's indicate that there is an individual effect for both the pistol and rifle weapon types, whereas there are no time effects for the pistol and rifle weapon types except for the Officer-Division and Enlisted-Division population groups with the pistol.

TABLE VI. SUMMARY OF ANOVA RESULTS

A. PISTOL

| DATA SET | SAMPLE SIZE | | F-RATIO | | D.F.(V ₁) | | D.F.(V ₂) | | F(V ₁ , V ₂) | | SIGNIFICANT? | |
|----------|-------------|---|---------|------|-----------------------|------|-----------------------|------|-------------------------------------|------|--------------|------|

K=NUMBER OF INDIVIDUALS

Y=NUMBER OF YEARS

C. CONTINGENCY TABLE ANALYSES

Contingency table analyses were performed for both the pistol and rifle weapon types for the following population groups in terms of gap size with emphasis on the Officer Combined and Enlisted Combined groups:

Officer-Division

Officer-Wing

Enlisted-Division

Enlisted-Wing

Officer Combined

Enlisted Combined

Officer-Enlisted Combined

In addition to the above population groups, the analyses were also performed on the below data sets which are combinations of the above population groups:

Set A: Officer-Division, Officer-Wing, Enlisted-Division, Enlisted-Wing

Set B: Officer Combined, Enlisted Combined

The analysis tested the hypothesis that there is no statistical difference in Δ SCORE associated with gap size and that there is no statistical difference in Δ SCORE associated with population groups. The hypotheses were tested at a level of significance of .1 utilizing the Chi-square test described in Siegel [Ref. 9]. The following two tables represent examples of the contingency analyses used to test both hypotheses.

DATA SET: ENLISTED-DIVISION (PISTOL)

Δ SCORE

| <u>GAP</u> | <u>-25+ to -21</u> | <u>-20 to -1</u> | <u>0 to 20</u> | <u>21 to 25+</u> |
|------------|--------------------|------------------|----------------|------------------|
| 0 | 4 | 5 | 6 | 7 |
| 1 | 13 | 9 | 13 | 12 |
| 2 | 2 | 5 | 6 | 8 |
| 3 | 2 | 5 | 3 | 5 |
| 4+ | 3 | 1 | 1 | 4 |

GAP SIZE: ZERO

Δ SCORE

| <u>DATA SET</u> | <u>-25+ to -21</u> | <u>-20 to -6</u> | <u>-5 to -15</u> | <u>6 to 15</u> | <u>16 to 25</u> | <u>25+</u> |
|-----------------|--------------------|------------------|------------------|----------------|-----------------|------------|
| Off-Div | 5 | 7 | 5 | 8 | 5 | 12 |
| Off-Wing | 2 | 4 | 7 | 3 | 3 | 11 |
| Enl-Div | 4 | 5 | 1 | 4 | 1 | 7 |
| Enl-Wing | 8 | 3 | 5 | 6 | 8 | 23 |

Table VII provides a summary of the contingency table analysis results for the hypothesis of no differences in Δ SCOREs associated to gap size. The hypothesis is not rejected for any of the data sets for the pistol weapon type and in the case of the rifle, is rejected for all data sets except for Officer-Division and Officer data sets.

TABLE VII. SUMMARY OF CONTINGENCY TABLE
ANALYSIS FOR TESTING

H_0 : No Difference in Δ SCOREs Due to Gap Size

A. PISTOL

| <u>DATA SET</u> | <u>χ^2 STATISTIC</u> | <u>DF</u> | <u>P-VALUE</u> | <u>ACCEPT OR REJECT H_0</u> |
|-----------------|--------------------------------------|-----------|----------------|--|
| Off-Div | 14.113 | 16 | .590 | ACCEPT |
| Off-Wing | 9.158 | 12 | .689 | ACCEPT |
| Enl-Div | 7.447 | 12 | .827 | ACCEPT |
| Enl-Wing | 12.737 | 12 | .388 | ACCEPT |
| Officer | 20.640 | 28 | .825 | ACCEPT |
| Enlisted | 20.700 | 24 | .638 | ACCEPT |
| Off-Enl | 32.200 | 40 | .800 | ACCEPT |

B. RIFLE

| <u>DATA SET</u> | <u>χ^2 STATISTIC</u> | <u>DF</u> | <u>P-VALUE</u> | <u>ACCEPT OR REJECT H_0</u> |
|-----------------|--------------------------------------|-----------|----------------|--|
| Off-Div | 7.971 | 12 | .787 | ACCEPT |
| Off-Wing | 14.960 | 8 | .060 | REJECT |
| Enl-Div | 41.170 | 20 | .005 | REJECT |
| Enl-Wing | 61.250 | 44 | .025 | REJECT |
| Officer | 24.610 | 28 | .628 | ACCEPT |
| Enlisted | 98.930 | 44 | .0001 | REJECT |
| Off-Enl | 95.78 | 44 | .0001 | REJECT |

Table VIII is a tabulated summary of the pistol contingency table analysis results for the hypothesis testing for no statistical differences in Δ SCOREs associated to the population groups. For the pistol, the hypothesis is not rejected

for all data sets except for data set B with a four plus year gap in shooting history. In the case of the rifle results tabulated in Table IX, the hypothesis is not rejected for data set A except for the zero gap and the four plus year gap in shooting history, and is accepted for data set B except for the zero gap case.

The prevalence of rejections in Table IX may possibly be due to mean age differences between the Officer Combined and the Enlisted Combined population groups, or to intelligence levels associated to the educational backgrounds of the two population groups. Since age and intelligence test scores are not available in the data, it is not possible to validate the effects of these influences on the populations under study.

The environmental and physiological aspects of firing a rifle over distances of 200 to 500 yards as compared to the pistol which is fired at a maximum range of 25 yards can impact on rifle Δ SCOREs. The introduction of this study introduced the reader to the physiological aspects of proficient marksmanship shooting which impacts upon a shooter's qualification score. As previously noted, the visual system is required to attain proper sight alignment and sight picture in the process of aiming the weapon. In terms of wind and visibility, the environmental influences of weather has a greater effect on shooting accuracy over longer distances than shorter distances. This problem can affect the rifle

TABLE VIII. SUMMARY OF CONTINGENCY TABLE ANALYSIS FOR TESTING

* Data Set A: Officer-Division, Officer-Wing, Enlisted-Division, Enlisted-Wing

Data Set B: Officer Combined, Enlisted Combined

ΔSCOREs since the environmental conditions may be different from one qualification period to another which may result in an increase or decrease in ΔSCORE.

D. REGRESSION ANALYSIS

Regression analyses were performed on the Officer Combined, Enlisted Combined and Officer-Enlisted Combined data sets for both pistol and rifle weapon types. The analyses involved regressing Time (in years) with ΔSCOREs to test the hypothesis that ΔSCOREs over time have zero slope, which indicates no change in marksmanship performance. The hypothesis is generated by Richards' [Ref. 10] APL program, determining the p-value from the F tables and comparing the p-value to the level of significance (α) of .1. If $p < \alpha$, reject the hypothesis, otherwise, do not reject the hypothesis. The following is an example of the computer output generated by the program for the Officer Combined data set and pistol weapon type with a one year gap in shooting history.

ANOVA

| <u>SOURCE</u> | <u>DF</u> | <u>SUM SQUARES</u> | <u>MEAN SQUARES</u> | <u>F-RATIO</u> |
|---------------|-----------|--------------------|---------------------|----------------|
| REGRESSION | 1 | 6.6784E2 | 6.6784E2 | 7.1568E-1 |
| RESIDUAL | 48 | 4.4791E4 | 9.3314E2 | |
| TOTAL | 49 | 4.5459E4 | | |

R SQUARE: 0.01469

STD ERROR: 30.54739

| COEFFICIENTS | T STATISTICS |
|--------------|--------------|
| 17.5312 | 1.8026 |
| -1.35 | -0.846 |

From the F table provided by Hicks [Ref. 8] with $F(1,48)$ equal to .71568 provided a p-value of .790. Since this p-value is greater than .1, the hypothesis that the slope is zero is not rejected.

The results of the regression analysis and hypothesis tests are tabulated in Table X which displays the mean and standard deviations for Time (in years) and Δ SCOREs across a gap in shooting history. The table also displays the slope and Y-intercept generated by the APL regression program, the sample size used to generate the statistics and whether the hypothesis was accepted or rejected. The random samples used in the analyses represents the first 50 Δ SCOREs attained for each gap size within the population group under study. In those situations in which 50 Δ SCOREs were not available, all Δ SCOREs for that gap size within the population group under study were utilized.

The results of the table indicate that the hypothesis of zero slope was not rejected for all gap sizes for the Officer Combined data set for both the pistol and rifle weapon types. In the case of the Enlisted Combined data set, the hypothesis of zero slope was rejected only for the pistol weapon type with a three year gap in shooting history and was not rejected in any other gap sizes.

E. CONDITIONAL PROBABILITY STATISTICS

For the purpose of providing the reader with additional information concerning the effects of a gap in an individual's shooting history, the mean scores, standard deviations, and frequency of occurrences were determined and tabulated in Appendix E for each of the data sets listed in paragraph A with the following conditions:

- A. Expert after gap given shot sharpshooter or better before the gap.
- B. Expert after gap given shot expert before the gap.
- C. Sharpshooter after gap given shot sharpshooter or better before the gap.
- D. Sharpshooter after gap given shot expert before the gap.
- E. Expert after gap given shot expert two times in row before the gap.
- F. Expert after gap given shot expert three times in row before the gap.
- G. Expert after gap given shot expert two times in a row.
- H. Expert after gap given shot expert three times in a row.

IV. CONCLUSIONS

A. POPULATION GROUPS

For the Officer population group, there is no statistical degradation in small arms marksmanship shooting performance resulting from a one, two, three, or four plus year gap in shooting history, for either the pistol or rifle weapon types. In the case of the Enlisted population group, there is a split between the pistol and rifle weapon types results. In the case of the pistol weapon type, there is no statistical degradation in shooting performance for a one or two year gap in shooting history; however, there is statistical evidence that a three or more year gap does have a significant effect upon shooting performance. In the case of the rifle weapon type, there is no statistical degradation of marksmanship performance across the one, two, three, or four plus year gap in shooting history.

B. SIGNIFICANCE OF CONCLUSIONS

The conclusions may provide a basis for future marksmanship training decisions which may result in a significant cost savings.

V. RECOMMENDATIONS FOR FURTHER STUDY

In addition to the analyses conducted for this study, it is recommended tht the following areas be studied:

1. Analyze the data by Military Occupational Specialty (MOS) to determine if there are any performance effects within the MOS groupings.

2. Analyze the data to determine the feasibility of constructing an analytical model which would predict marksman-ship performance after the individual has achieved a specific level of performance.

3. Perform analyses with Δ SCORE for zero gap based on spans of years consistant with those involved in the gap data.

4. Conduct a cost/benefit analysis of proficiency shooting, using operational measure of the benefits of small arms accuracy.

APPENDIX A

DESCRIPTION OF COURSES FOR INDIVIDUAL MARKSMANSHIP M16A1 RIFLE, M1911A1 PISTOL AND .38 CALIBER REVOLVER

A. RIFLE COURSES

1. Course Known Distance (KD)

| <u>STAGE</u> | <u>RANGE (YARDS)</u> | <u>TIME (MINS)</u> | <u>ROUNDS</u> | <u>TARGET</u> | <u>POSITION</u> |
|--------------|--------------------------|------------------------|---------------|---------------|---------------------|
| 1 | 200 | 5 | 5 | "A" | Sitting |
| 2 | 200 | 5 | 5 | "A" | Kneeling |
| 3 | 200 | 5 | 5 | "A" | Standing |
| 4 | 200 | 1 | 10 | "D" | Standing to Sitting |
| 5 | 300 | 5 | 5 | "A" | Sitting |
| 6 | 300 | 1 | 10 | "A" | Standing to Prone |
| 7 | 500 | 10 | 10 | "B" | Prone |

a. For stages 4 and 6, two magazines are loaded with five rounds each. The shooter is required to change magazines and reload his rifle from the cartridge belt.

b. The dimensions of the "A", "D" and "B" modified targets are as depicted in Figures (5) to (7). A hit in the black is given the maximum score value of "5". Hits outside the rings are "2".

c. Each shot is marked and disked.

d. Classification scores:

| | <u>EXPERT</u> | <u>SHARPSHOOTER</u> | <u>MARKSMAN</u> |
|-------|---------------|---------------------|-----------------|
| Score | 220 | 210 | 190 |

APPENDIX B

RECORD KEEPING REQUIREMENTS AND PROCEDURES

A. SCORECARDS AND SCORING

The following is a list of procedures which are utilized in the recording of marksmanship scores for record as required by reference (5).

1. Scorecards are kept at each target in the pits. The cards will bear the date, the number of the target, and the number of the relay.

2. Entries on all scorecards are made in ink or indelible pencil. When necessary corrections are made, each correction will be initialed by the block officer supervising the scoring in the pits.

3. The score at each target is kept by a scorer. As soon as a score is completed, the scorecard will be signed by the scorer and collected and verified by the block officer. Upon completion of the day's firing, scorecards will be turned over to the range officer.

4. The range officer will prepare an accurate roster of the firing detail to include the firer's identifying information, his target number, and his relay number.

5. Upon completion of record firing, the range officer will collect all scorecards, place the firer's identifying information on the scorecard, and forward all scorecards to

the rifle range commanding officer, who will cause the scores to be transmitted to the various activities concerned.

6. After the record score has been verified, the score-cards will be kept available for inspection among the rifle range records for 1 year and then destroyed.

7. Upon completion of record firing, the date, range, course, weapon, score and qualification classification attained will be recorded in the OQR/SRB of each officer or enlisted Marine concerned on NAVMC 118 form as depicted in APPENDIX D.

B. GENERAL RULES

The following are rules which provide scoring procedures and procedures to be utilized in unusual situations:

1. Sighting shots are prohibited during record firing.
2. Each shot fired on the wrong target will be scored as a miss.
3. Ricochets will be counted as misses.
4. When a target has more than the authorized number of hits, the following will govern:
 - (a) Slow Fire. If two or more shots strike the target at approximately the same time and are not of the same value, the shot with the highest value is recorded.
 - (b) Rapid Fire. If a target has more than the prescribed number of hits, all of the same value, the targets will be scored with the value of the number of shots actually fired by the individual. If the target has more than the prescribed

number of hits, not all of the same value, the target will not be marked and the individual will be required to refire the entire string.

5. If a target is withdrawn just as a shot is fired in slow fire or before the time limit has expired in rapid fire, the shooter will be allowed to refire the shot in slow fire or the entire string in rapid fire, as appropriate. It must be substantiated, however, that the target was withdrawn prematurely.

6. If a slow-fire string is interrupted or delayed through no fault of the individual, he is given extra time or allowed to finish the string at the first opportunity. No other stage will commence until the previous stage has been completed.

7. If a weapon stoppage occurs during rapid fire, the weapon will be inspected by the officer in charge of the firing or a qualified armorer, and the following procedures will be followed:

(a) If it is determined that the stoppage was caused by a mechanical failure of the weapon or by faulty ammunition, the scores will be disregarded and the individual will be permitted to refire the entire string.

(b) If it is determined that the stoppage was caused through the fault or neglect of the individual, all unfired rounds will be scored as misses.

(c) In no case where a stoppage occurs will the target be marked until the nature of the stoppage has been determined.

C. TARGET SYSTEM

The following describes the type of targets utilized for the various strings of fire:

1. The standard "A" target, bulls-eye, paper, 200 and 300 yard targets are used for all slow fire stages at 200 and 300 yards, Figure (1).

2. The standard "D" target, silhouette, paper, prone images target will be used for sustained fire stages, Figure (2).

3. The 500 yard stage is fired on the "B" Modified target. This target consists of the "E" target, silhouette, paper, kneeling, image superimposed upon a bulls-eye paper target, Figure (3).

4. The E-SA target utilized for pistol requalification consists of target "E" silhouette with a Standard American 25 yard target over it, the "five ring" of the target being tangent to the shoulder of the silhouette and overlapping sides trimmed off or folded and pasted to the back of the target, Figures (4) and (5).

D. RIFLE COURSE SCORING SYSTEM

A value of five points will be awarded for any shot within or touching any portion of the bulls-eye on the "A" target or the silhouette of the "D" or "B" targets. Any bullet

striking the target outside the silhouette or bulls-eye shall be scored with the point value indicated by the shot hole, being a four, three, or two. Any shot striking the target outside the "three ring" is scored as a value of two. Any shot hole outside the target paper area is scored as a miss.

The "% SHOOTERS W/THIS COND." column of the Appendix was calculated by dividing the "NBR SHOOTERS W/THIS COND." column by the total number of individuals that had a gap within the indicated data set except for parts G and H. The "% SHOOTERS W/THIS COND." column for parts G and H was calculated by dividing the "NBR SHOOTERS W/THIS COND." column by the total number of shooter involved with the population set as provided in Table IV.
